

## 1 Overview

**1.1 Location** `$<APPSDKSamplesInstallPath>\samples\opencl\cl\`

**1.2 How to Run** See the *Getting Started* guide for how to build samples. You first must compile the sample.

Use the command line to change to the directory where the executable is located. The pre-compiled sample executable is at `$<APPSDKSamplesInstallPath>\samples\opencl\bin\x86\` for 32-bit builds, and at `$<APPSDKSamplesInstallPath>\samples\opencl\bin\x86_64\` for 64-bit builds.

Ensure that the OpenCL 2.0 environment is installed.

Type the following command(s).

1. `ImageBinarization`  
This runs the program with the default options.
2. `ImageBinarization -h`  
This prints the help file.

**1.3 Command Line Options** Table 1 lists, and briefly describes, the command line options.

**Table 1 Command Line Options**

Short Form	Long Form	Description
-h	--help	Shows all command options and their respective meanings.
	--device	Devices on which the program is to be run. Acceptable values are cpu or gpu.
-q	--quiet	Quiet mode. Suppresses most text output.
-e	--verify	Verify results against reference implementation.
-t	--timing	Print timing related statistics.
	--dump	Dump binary image for all devices.
	--load	Load binary image and execute on device.
	--flags	Specify compiler flags to build the kernel.
-p	platformId	Select platformId to be used (0 to N-1, where N is the number of available platforms).
-d	deviceId	Select deviceId to be used (0 to N-1, where N is the number of available devices).

Short Form	Long Form	Description
-v	version	AMD APP SDK version string.
-i	iterations	Number of iterations for kernel execution.
-x	globalThreadsHistogram	Global work-size for Histogram Kernel

## 2 Introduction

This sample demonstrates how to use images with read\_write qualifier support, which is introduced in the OpenCL 2.0 OpenCL C programming language. This sample uses the `clCreateImage` API with the `CL_MEM_READ_WRITE` flag to create image objects, which are read and written by a kernel.

This sample must be run in the OpenCL 2.0 environment.

## 3 Implementation Details

The sample implements an Image Binarization algorithm, which converts a given gray-scale image into a binary image. The sample implements two kernels:

**ImageHistogramKernel:** This kernel calculates the histogram bins of a given gray-scale image. This histogram bins are then passed to the host. A threshold value is calculated on the host using Otsu's algorithm.

**ImageBinarizationKernel:** This kernel takes an image object and Otsu's threshold value as input. Each thread first reads a pixel and then changes the pixel value based on the threshold. Finally, the modified pixels are written back to the same image. (**Note:** This sample uses sampler read.).
